

Visualize all identities, identify and remediate findings, and detect identity threats *with* Identity Security Insights

There is an explosion of identities beyond the traditional network perimeter and a massive increase in identity-related vulnerabilities. Organizations lack continuous visibility of identities across all systems, especially on rapidly expanding cloud systems.

BeyondTrust Identity Security Insights empowers organizations with clear visibility into all identities, privileges, and access, revealing their exact impact on your security posture. Gain a new intelligent layer to your PAM solutions to detect threats resulting from compromised identities and privileged access misuse.

According to research conducted by the Identity Defined Security Alliance (IDSA), 79% of organizations have had an identity-related breach in the last two years. Organizations are seeking better methods to detect and respond to identity threats.

Feature highlights include:

Centralized Dashboard

Identify over-privileged users and inactive or partially revoked identities, and truly understand their overall blast radius impact across your entire estate.

Proactive Recommendations

Uncover high risk identities and privileged accounts and remove unnecessary privileges before they are exploited by an attacker.

Identity Security Detections

Detect anomalies and known attack techniques, and remediate activity from compromised identities, accounts, or privileges.

Gain Comprehensive Visibility

Visualize all identities with correlated access and privileges across the estate.

Reduce the Attack Surface

Minimize the risk of data breaches and other malicious activities by proactively addressing identity vulnerabilities.

Improve Efficiency

Leverage cross-solution context to detect and mitigate identity security events efficiently.
